Attempt : 1
Total Mark : 10
Marks Obtained : 10

Section 1 : Coding

1. Problem Statement

In a messaging application, users maintain a contact list with names and corresponding phone numbers. Develop a program to manage this contact list using a dictionary implemented with hashing.

The program allows users to add contacts, delete contacts, and check if a specific contact exists. Additionally, it provides an option to print the contact list in the order of insertion.

Input Format

The first line consists of an integer n, representing the number of contact pairs to be inserted.

Each of the next n lines consists of two strings separated by a space: the name of the contact (key) and the corresponding phone number (value).

The last line contains a string k, representing the contact to be checked or removed.

Output Format

If the given contact exists in the dictionary:

1. The first line prints "The given key is removed!" after removing it.
2. The next n - 1 lines print the updated contact list in the format: "Key: X; Value: Y" where X represents the contact's name and Y represents the phone number.

If the given contact does not exist in the dictionary:

1. The first line prints "The given key is not found!".
2. The next n lines print the original contact list in the format: "Key: X; Value: Y" where X represents the contact's name and Y represents the phone number.

Refer to the sample outputs for the formatting specifications.

Sample Test Case

Input: 3
Alice 1234567890
Bob 9876543210
Charlie 4567890123
Bob

Output: The given key is removed!
Key: Alice; Value: 1234567890
Key: Charlie; Value: 4567890123

Answer

```
// You are using GCC
#include <stdio.h>
#include <stdlib.h>
#include <string.h>

#define TABLE_SIZE 101
```

```
typedef struct Contact {
    char name[11];
    char phone[16];
    struct Contact* next;
} Contact;

typedef struct InsertionOrder {
    Contact* contact;
    struct InsertionOrder* next;
} InsertionOrder;

Contact* hash_table[TABLE_SIZE];
InsertionOrder* insertion_order_head = NULL;
InsertionOrder* insertion_order_tail = NULL;

unsigned long hash(const char* str) {
    unsigned long hash = 5381;
    int c;
    while ((c = *str++))
        hash = ((hash << 5) + hash) + c;
    return hash % TABLE_SIZE;
}

Contact* create_contact(const char* name, const char* phone) {
    Contact* new_contact = (Contact*)malloc(sizeof(Contact));
    strncpy(new_contact->name, name, 10);
    new_contact->name[10] = '\0';
    strncpy(new_contact->phone, phone, 15);
    new_contact->phone[15] = '\0';
    new_contact->next = NULL;
    return new_contact;
}

void insert_contact(const char* name, const char* phone) {
    unsigned long index = hash(name);
    Contact* new_contact = create_contact(name, phone);
    new_contact->next = hash_table[index];
    hash_table[index] = new_contact;

    InsertionOrder* new_node = (InsertionOrder*)malloc(sizeof(InsertionOrder));
    new_node->contact = new_contact;
```

```
    new_node->next = NULL;
    if (!insertion_order_head) {
        insertion_order_head = insertion_order_tail = new_node;
    } else {
        insertion_order_tail->next = new_node;
        insertion_order_tail = new_node;
    }
}

int delete_contact(const char* name) {
    unsigned long index = hash(name);
